Linux

User & Group Management

Explained Simply

Learn who you are, your groups,
and user information in Linux

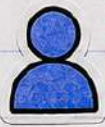

• whoami •

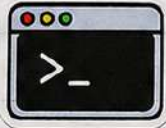

Shows the current logged-in user.

Syntax :

```
whoami
```

Example :

```
whoami
```

Output :

```
anu
```

Tip: It is useful to quickly know which user you are.

id

Shows user ID (UID), group ID (GID) and group membership.

Syntax :

```
id
```

Example :

```
id
```

Output :

```
uid=1000(anu) gid=1000(anu) groups=1000(anu),  
27(sudo), 1001(devops)
```

Tip: Useful to see your user ID, primary group and other groups.

groups

- Displays the groups the current user belongs to.

Syntax :

```
groups
```

Example :

```
groups
```

Output :

```
anu adm cdrom sudo dip plugdev  
docker
```

Tip: This command helps you see all groups you are a member of.

passwd

- Change your account password.

Syntax :

```
passwd
```

Example :

```
passwd
```

What happens :

- You'll be asked to enter your current password.
- Then enter your new password.
- Re-enter the new password to confirm.

Tip: Use a strong password and keep it private for better security.

Summary

Today we learned important commands to manage users and groups in Linux. ★

Commands Covered

- 1 `whoami` - shows the current logged-in user.
- 2 `id` - shows user ID, group ID and groups.
- 3 `groups` - displays the groups you belong to.
- 4 `passwd` - change your account password.

Keep practicing daily
and keep growing! ♥

Tip: Understanding users and groups is the key to managing Linux like a pro!
